

Danish company launches unique concept at the Big 5 PMV

When fibo intercon a/s participates in the Big 5 PMV exhibition in November the company's main objective will be to introduce its unique mobile and semi-mobile concrete batching plants to the MENA markets.

A unique concept

Like other mobile and semi-mobile concrete batching plants on the market fibo intercon's solutions make contractors and construction companies independent of concrete works by enabling them to produce concrete wherever and whenever they want and in the quality and quantity they require. But any similarity with other plants stops at that.

The unique compact design of the fibo intercon plants means that they require a minimum of space at the construction site. The smaller plants need so little space that they can fit into even narrow places or buildings. This compactness makes the plants ideal for urban areas and since they are indeed self-sufficient concrete factories they are also suitable for work in remote areas.

In spite of their relatively small size the batching plants offer high capacity. Capacities range from 10 – 80 M³ depending on the number of aggregates involved, the pan mixer size etc. All plants are capable of producing a high, uniform concrete quality and the integrated control system makes it possible to document all aspects of the batching process.

At the same time the plants have an unprecedented flexibility. They require no foundation and they are easy to erect, make ready for production and dismantle. The user friendly control system requires no previous knowledge and makes it easy to monitor and control all processes. The plants are also future proofed since it is possible to add new features and equipment to meet new requirements and standards at any time.

The plants have an unsurpassed mobility. The mobile plants mounted on wheels can naturally be moved around the building site as requires. But even when it comes to the semi-mobile models it is easy and quick to pack the plants together and transport them between construction projects. This requires only a minimum of equipment and time resulting in low switching costs.

Adapted to the MENA markets

fibo intercon is already experienced in developing solutions to meet the special requirements of customers in the MENA region. The company has for instance developed a so-called dosing station entirely with this region in mind. The dosing station is designed to dose aggregates at temperatures as high as 30-60 °C. It is equipped with its own water tank and generating set making it ideal for working in arid, isolated desert areas or in areas where the combination of heat and traffic problems may be detrimental to the batching process. The dosing station has already proved its worth in Iraq where 19 plants are currently used for establishing irrigation canals or in the oil industry.

Another solution is a newly developed ice machine which produces, crushes and transfers ice to the pan mixer of batching plant and thus keeps the concrete mixture from agglutinating prematurely. The ice machine can be combined with any fibo intercon concrete batching plant and the solution will of course be presented on the company's stand at the Big 5 PMV.

Present in the region

fibo intercon is currently strengthening its position in the MENA region. Consequently it is extending its representative network and today the company is represented in Iraq, Lebanon, Maghreb, Dubai and Qatar. It has also just opened its own sales office in Abu Dhabi. Since the Big 5 PMV brings together people from all over the region fibo intercon sees this event as an ideal opportunity to meet new potential business partners.

Stand location

fibo intercon's stand is located in the Arena PMV at stand number A8.
